# **Statisitcs**

# LLN

$$\lim_{n \to \infty} \left| \frac{1}{n} \sum_{i=1}^{n} x_i - \mathbb{E} \left[ x \right] \right| = 0$$

#### Unbiasedness

$$\operatorname{Bias}_{\theta} = \mathbb{E}\left[\hat{\theta}\right] - \theta = \mathbb{E}\left[\hat{\theta} - \theta\right] = 0$$

# Consistency

$$\lim_{n \to \infty} \mathbf{P}\left( \left| \widehat{X} - \frac{1}{n} \sum_{i=1}^{n} X_i \right| \le \epsilon \right) = 1$$

# Properties of Gaussians

$$X \sim \mathcal{N}(\mu, \sigma^2) \implies Y = aX + b \sim \mathcal{N}(a\mu + b, a^2\sigma^2)$$
$$X \sim \mathcal{N}(\mu_x, \sigma_x^2), \qquad Y \sim \mathcal{N}(\mu_y, \sigma_y^2), \qquad \implies \quad Z = X + Y \sim \mathcal{N}(\mu_x + \mu_y, \sigma_x^2 + \sigma_y^2)$$

# **Information Theory**

# Information

#### **Information Gain**

$$\mathbf{I}\left(S\right) = \log_2 \frac{1}{\mathbf{P}\left(S\right)}$$

$$\mathbf{I}(Y, X_i) = \mathbf{H}[Y] - \mathbf{H}[Y|X_i]$$

# Entropy

$$\mathbf{H}[S] = \sum_{s \in \{S\}} \mathbf{P}(S=s) \cdot \mathbf{I}(S=s) = \sum_{s \in \{S\}} \mathbf{P}(S=s) \log_2 \frac{1}{\mathbf{P}(S=s)}$$
$$= \mathbb{E}[\log_2 1/\mathbf{P}(S=s)] = -\mathbb{E}[\log_2 \mathbf{P}(S=s)]$$
$$= -\sum_{s \in \{S\}} \mathbf{P}(S=s) \log_2 \mathbf{P}(S=s)$$

# Learning Theory

# PAC Learning

$$\mathbf{P}\left(\left|\hat{\theta} - \theta^*\right| \le \epsilon\right) \ge 1 - \delta$$

$$\mathbf{P}\left(\left|\hat{\theta} - \theta^*\right| > \epsilon\right) < \delta$$

#### **Decision Theory**

# Risk

$$Risk(f) = R(f) := \mathbb{E}_{(X,Y)}[loss(Y, f(X))]$$

$$R(f^*) \le R(f), \ \forall f \in \mathcal{F}$$

### **Bayes Optimal Rule**

$$f^*(P) = \underset{f}{\operatorname{arg\,min}} \mathbb{E}_{(X,Y) \sim P}[\operatorname{loss}(Y, f(X))]$$

#### **Emperical Risk Minimization**

$$\hat{f}_n = \arg\min_{f} \frac{1}{n} \sum_{i=1}^{n} [\log(Y_i, f(x_i))] \quad \xrightarrow[n \to \infty]{\text{LNN}} \quad \arg\min_{f} \mathbb{E}_{(X, Y)} [\log(Y, f(X))]$$

#### Risk

#### True Risk **Emperical Risk Excess Risk**

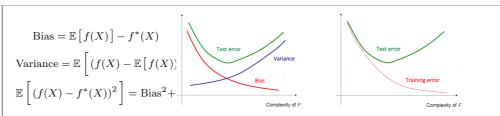

$$R(f) := \mathbb{E}_{(X,Y)}[\ell(f(X), Y)] \qquad \widehat{R}_{\mathcal{D}}(f) := \frac{1}{|\mathcal{D}|} \sum_{i \in \mathcal{D}} [\ell(f(X_i), Y_i)] \qquad \mathbb{E}\left[R(\hat{f}_n)\right] - R(f^*)$$

#### Structural Risk

$$\left|R(f)-\widehat{R}_n(f)\right| \leq C(f) \qquad \forall \, f \in \mathcal{F} \\ R(f) \leq \widehat{R}_n + C(f), \qquad \forall \, f \in \mathcal{F} \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{true risk.} \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as a } pessimistic \text{ estimate of } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) + C(\widehat{f}_n) \text{ as } \\ \text{Use } \widehat{R}_n(\widehat{f}_n) + C(\widehat{f}_n) + C($$

# **Risk Estimation**

# Bias-Variance Tradeoff

 $\mathcal{D} = \left\{ (X_i, Y_i) \right\}_{i=1}^n$ 

#### K-Fold CV

# LOO CV

# Random Subsampling

#### Hold-out Method

1. Split into two sets

$$\underbrace{\mathcal{D}_T = \left\{ (X_i, Y_i) \right\}_{i=1}^m}_{\text{training set}}$$

$$\underbrace{\mathcal{D}_T = \left\{ (X_i, Y_i) \right\}_{i=1}^m}_{\text{training set}} \qquad \underbrace{\mathcal{D}_V = \left\{ (X_i, Y_i) \right\}_{i=m+1}^n}_{\text{holdout set}}$$

- 2. use  $\mathcal{D}_T$  to train a predictor  $\hat{f}_{\mathcal{D}_T}$
- 3. use  $\mathcal{D}_V$  to evaluate the predictor  $\hat{R}_{\mathcal{D}_V}(\hat{f}_{\mathcal{D}_T})$

# Estimating True Risk

Estimate the error of a predictor on n data If K is large (close to n), bias of error estimate is small since each training set has close to n data

However, variance of error estiamtes is high since Run 1 each validation set has fewer data points and  $\widehat{R}_{V_k}$  Run 2 might deviate a lot from the mean.

#### **Risk Minimization**

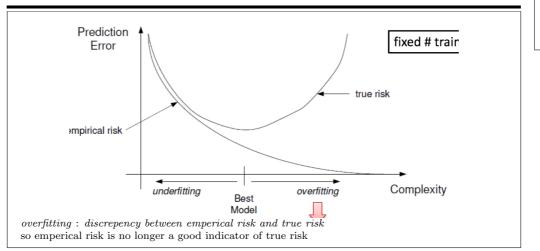

# **Emperical Risk Minimization**

# Structural Risk Minimization

$$\widehat{f_n} = \underset{f}{\operatorname{arg\,min}} \frac{1}{n} \sum_{i=1} n[\operatorname{loss}(Y_i, f(x_i))]$$

$$\hat{f}_n = \underset{f \in \mathcal{F}}{\arg\min} [\hat{R}_n(f) + \lambda C(f)]$$

#### **Overfitting**

# Regularization

# Complexity Regularization

$$\hat{f}_n = \arg\min_{f \in \mathcal{F}} \{ \hat{R}_n(f) + C(f) \}$$

#### **Information Criteria**

AIC (Akiake IC) C(f) = #parameters

Allows # parameters to be infinite as # training data n becomes large

BIC (Bayesian IC)  $C(f) = \#parameters * \log n$ 

Penalizes complex models more heavily – limits complexity of models as # training data n becomes

# **Model Selection**

- define a finite set of model classes
- estimate true risk for each model class
- select model class with lowest estimated true risk

Model classes  $\{\mathcal{F}_{\lambda}\}$  of increasing complexity  $\mathcal{F}_1 < \mathcal{F}_2 < \dots$ 

$$\min_{\lambda} \min_{f \in \mathcal{F}_{\lambda}} J(f, \lambda)$$

- given  $\lambda$  estimate  $\hat{f}_{\lambda}$  using emperical / structural / complexity regularized risk minimization
- select  $\lambda$  for which  $\hat{f}_{\lambda}$  has minimum true risk estimated using cross-validation / hold-out / information criteria

# Generalization Error

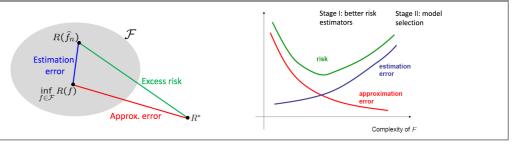

#### **Terms**

estimated predictor :=  $\hat{f}_n$ optimal predictor :=  $f^*$ risk of estimated predictor :=  $R(\hat{f}_n)$ expected risk :=  $\mathbb{E} \mid R(\hat{f}_n)$ risk of optimal predictor :=  $R(f^*)$ excess risk :=  $\mathbb{E} \left| R(\hat{f}_n) \right| - R(f^*)$ 

#### True Risk Decomposition

$$\mathbb{E}\left[R(\hat{f}_n)\right] - R^* = \underbrace{\left(\mathbb{E}\left[R(\hat{f}_n)\right] - \inf_{f \in \mathcal{F}} R(f)\right)}_{\text{estimation error}} + \underbrace{\left(\inf_{f \in \mathcal{F}} R(f) - R^*\right)}_{\text{approximation error}}$$

Estimation Error: due to randomness of training data Approximation Error: due to restriction of model class
